ChatGPT

Plan Django Assessment

You

i have a internship assesment , i provide you all details and we start doing our assessment - Python/Django Hiring Assignment: AI-Assisted Box
Selection System
Context
We operate an ecommerce platform. When a customer places an order, the warehouse team
needs to know which shipping box should be used. Each product has dimensions and
weight. Each box has internal dimensions, maximum weight capacity, and cost.
Your task is to design and build a small Django-based system that recommends the most
suitable box for an order.
You are allowed to use AI tools such as ChatGPT, Claude, Cursor, GitHub Copilot, or similar
tools. However, your submission must clearly show your own thinking.

AI Usage
You may use AI tools, but include an AI_USAGE.md file containing:
1. Which AI tool(s) you used.
2. The prompts you gave.
3. What output you accepted.
4. What output you rejected or modified.
5. Any mistakes the AI made.
6. How you verified the final code.
Submission
Please submit:
1. GitHub repository link.
2. README.md.
3. AI_USAGE.md describing tools, prompts, accepted/rejected outputs, mistakes found, and

Take your curiosity further
Scan to get the ChatGPT app

verification steps.
4. Export the chat transcript and attach and include in your repository. Make sure that you
don't generate this using AI. Your assignment will be rejected immediately if we see that you
used AI for this.
5. What did you learn in this assignment? Again, not to use AI to generate an answer for

this.
6. Test cases.
7. Test run output, either:
- GitHub Actions link,
- terminal output pasted

ChatGPT

You

lets plan what we need to do ,firstly we make a algorithm to choice perfect box for the item

ChatGPT

You

absolutely , i have an idea let me correct if i'm making any mistake - we can check the length, width, height and capacity of the box then store the boxes into a dictionary then we can find which box is cheaper and best fit for as

ChatGPT

Take your curiosity further
Scan to get the ChatGPT app

You

forget all things, we just compare all 6 permutations and for best fit and who setisfy this all we can add them in our dictionary

ChatGPT

You

i created django project and make a boxes app in it and create a model according to the requirements now i need a frontend to get product info and display the best fit box build it

Worked for 14s

ChatGPT

You

ok looking nice and i connect it with box_recomendation view and everything working as we want

ChatGPT

You

create test.py

ChatGPT
